

## 1 Introduction

The *tex-label* package allows you to label parts of your document just like labelling e-mail.

## 2 Usage

You can use the `\labels` command when you want to label some part of your document. The labels remain effective until you issue the next `\labels` command.

## 3 Example

See `tex-label-demo.tex` and `tex-label-demo.pdf`

## 4 Customizing

You can change the color of label text and label background by redefining *label-color* and *label-bg-color* respectively.

For ex:- to redefine label text to white use

```
\definecolor{label-color}{rgb}{1,1,1}
```
